

South Carolina Drycleaning Restoration Trust Fund Program Status Report December 15, 2006

South Carolina Department of Health and Environmental Control
Bureau of Land and Waste Management
Site Assessment and Remediation Division

A Message from the Director

During the 2004 South Carolina legislative session, the General Assembly added a 1% environmental surcharge on drycleaning to augment the revenue source to the Fund. This change effectively doubled the amount of money available to perform the environmental assessment and remediation activities on which the drycleaning program is based. As the second year, with this 1% in effect, came to a close it is good to report that the increased revenue held steady. Active remediation is taking place at five sites, including three sites that are employing the innovative use of underground ozone injection to remediate contaminated groundwater. Potassium permanganate, a salt-like material, was injected into the groundwater to clean up contamination at the fourth site. The fifth site is in the process of having a soil vapor extraction system with recirculation wells installed. Cleanup has been completed at four other sites with health impacts brought below applicable state and federal levels.

When the outline in the Five-Year Funding Projection (Section 2) was engineered, we anticipated a more aggressive schedule in 2006. However, there was a large amount of turnover in the personnel of the drycleaning program. John Cresswell has assumed the duties of Program Manager with Lisa Appel as the only remaining full-time employee of the program. Two other positions are in the process of being filled. We expect to be fully staffed in early 2007 and are looking forward to accomplishing a great deal in the coming months.

Currently applications are being evaluated for eligibility and will soon be ranked relative to the approximately 400 sites already in the prioritization database. Further information on the prioritization process is available in Section 4, and the currently-ranked sites are listed by county in Section 5. Once we complete prioritization of the new sites, we will re-evaluate our priority list and initiate assessment activities on the newly-added high priority sites. The final deadline for applying to the Fund for eligibility with a \$25,000 deductible was November 27, 2006. Only new drycleaners can now apply for eligibility.

I hope that you find this report on the Fund informative and interesting to read. We welcome your inquiries and participation for the successful implementation of this program.

J. Keith Lindler, P.E., Director
Division of Site Assessment and Remediation
Bureau of Land and Waste Management
South Carolina Department of Health and Environmental Control

1. Introduction

In 1995, the South Carolina General Assembly created the Fund to address environmental contamination resulting from drycleaning activities in South Carolina. The Fund was formed at the urging of the drycleaning industry to protect small drycleaners from the potentially devastating financial responsibility of environmental problems at their facilities. Many of these problems date back numerous years and have resulted from operational and disposal practices that were common before the industry was environmentally regulated. Since small businesses rarely have the financial capital to deal with such issues, problems of contamination were often not addressed.

Several hundred drycleaners initially joined the Fund, but not every drycleaner in South Carolina participated. Drycleaners who used petroleum-based solvents were given a one-time opportunity in 1995 to opt-out of the Fund. These businesses are not required to pay the annual fees or solvent taxes paid by participating drycleaners, but by not participating, they are also not allowed to reap the benefits of the Fund if contamination is ever discovered on their property. Over the years, some of these original “opt-outs” have since chosen to participate in the Fund.

When the Fund was created, it was known that contamination would likely be found, but the extent of the problem has proven to be larger than initially understood. Since field investigations of the highest priority drycleaning sites began, contamination plumes have been found in groundwater at drycleaners across South Carolina. In addition, public and private water supply systems as well as some streams and other surface water bodies have been impacted by contamination. In short, drycleaning-related environmental contamination has been found on almost every site investigated to date.

A newer dry-to-dry model machine with built-in containment. These higher-efficiency machines release only small amounts of solvent to the environment.

There are several reasons for the presence of solvents in the soil and groundwater around drycleaning facilities. The most commonly used drycleaning solvents, perchloroethylene (PCE, or “perc,” an industrial chemical) and various compounds derived from petroleum (Stoddard solvent), easily pass through many materials, including the concrete floors common at drycleaning plants. Most of the older drycleaning transfer machines, which require solvent-laden clothes to be moved from the machine to a dryer, were a source of release to the environment. Regulations now require that the floors in drycleaning plants be sealed with epoxy paint or other impermeable surface. Newer dry-to-dry drycleaning machines, pictured above, are designed to both wash and dry clothes in the same machine, thus avoiding drips and spills occurring during the transfer of clothes from the washer to the dryer.

Other releases came from waste by-products created by the filtering and distillation processes necessary for re-use of solvent in the drycleaning plant. These wastes contain small amounts of solvent and are now collected by hazardous waste disposal companies. Before the disposal companies began operating in the late 1980’s, the wastes were commonly discarded directly onto the ground, into the sewer system, or into leaky dumpsters. Also, since older drycleaning machines vent solvent vapors to the outside, solvents would condense in cool weather and collect on nearby exposed soil.

A spotting station, used for removal of stubborn stains with concentrated PCE prior to drycleaning. Release of PCE from this type of station is another potential route for drycleaning solvents to enter the environment.

Since the solvents do not break down quickly in the environment, small releases can eventually accumulate into a significant source of contamination under the drycleaning plant. Solvent trapped in the soil beneath a drycleaning facility can be a continuing source of groundwater and soil contamination for many years. As a result, a drycleaning plant may be an ongoing source of contamination long after it has stopped operating or has implemented containment measures to prevent further releases.

Since the Fund is limited in size, it cannot immediately address the environmental problems at every participating site. Two primary mechanisms have been implemented to ensure the sites that present the most significant health impacts are addressed first and that there is enough money in the Fund to continue the work into the future. The first is a priority list (further details in Section 4), based on health impacts, that is created from detailed information gathered on each participating drycleaning site. The second mechanism was implemented in 2004 when the South Carolina General Assembly amended the Act to provide for additional money to come into the Fund. These additional sources of funds come from the 1% environmental surcharge on drycleaning sales and from annual fees on new or delinquent drycleaners that are required to participate in the Fund.

One of the most positive program outcomes is the enhancement of environmentally sustainable business practices by participating drycleaners. The Act requires participating drycleaning operators to certify to DHEC that they are handling their drycleaning solvents in an environmentally responsible manner. As a result, drycleaners participating in the Fund have maintained or implemented containment measures that do not allow solvents to be released to the soil or groundwater. While this will not remove contamination that has already been released into the environment, these measures will greatly reduce the probability of future releases therefore lessening the impact that the drycleaning solvents have on the environment.

Contained waste storage behind a drycleaning facility.

2. Fund Status and Five-Year Funding Projection

Funding Source

The South Carolina Department of Health and Environmental Control (DHEC) is responsible for administering the South Carolina Drycleaning Restoration Trust Fund (the Fund). The South Carolina Department of Revenue (DOR) is responsible for drycleaner registration and collection of money into the Fund.

Revenue for the Fund has historically been derived from two sources: 1) Registered facilities pay yearly fees into the Fund based on their number of employees; and 2) A surcharge is assessed on every gallon of drycleaning solvent purchased for use in the state. The annual fees are assessed on a sliding scale that depends on the number of employees at each drycleaning business. Surcharges are not collected from drycleaners that registered with DOR as opting out of the Fund.

As a result of declining revenues to the Fund (Figure 1), a legislative change enacted in May 2004 added a 1% sales tax on drycleaning as a third source of revenue. Imposition of the 1% tax began on July 1, 2004 (Fiscal Year 2005, FY05). With the addition of the 1% tax, revenue into the Fund increased from \$655,000 in FY04 to \$1,284,000 in FY05 and to \$1,610,701 in FY06.

Figure 1: Drycleaning Restoration Trust Fund Yearly Income

The historical total income into the Fund through July 1, 2006 is \$10,142,180, and historical total expenditures through July 1, 2006 have been \$8,106,809 (Figure 2). For the first three years, the only expenses to the Fund were minor amounts necessary to cover DHEC's expenses while

regulations and procedures were developed. Expenses increased slightly over the next two years as a limited amount of fieldwork was conducted to obtain information necessary to prioritize the large number of sites that had applied to become eligible for the Fund. By FY01, expenditures started increasing as assessment activities began on several sites and remediation systems were implemented. By early FY04, the Fund balance had dropped to a point that work had to be suspended on most sites. With the addition of the sales tax as a revenue source, DHEC has begun assessing and remediating sites once again.

Figure 2: Comparison of Income versus Expenditures

Funding Needs

There are 272 drycleaning plants that have registered into the Fund as of July 1, 2006. Not all of these plants are still operating. In addition, there are 182 former drycleaning plants that stopped operating prior to 1995 (when the original legislation was enacted) that are also eligible for the Fund. Altogether, there are 454 known drycleaning sites that may use Fund monies. As of November 27, 2006 only new drycleaning facilities may apply for eligibility to the Fund. However, unless you had the opportunity to opt out in 1995 (petroleum users), then you must register your facility with the Department of Revenue and pay into the Fund.

It is estimated that \$147 million will be required over the lifetime of the Fund to assess and clean up eligible sites. This amount may be considerably under-estimated because it is based on assumptions that future sites will not require the level of funding expended thus far and has not been adjusted for inflation. The actual amount may be higher by the time all drycleaning sites are cleaned up. This figure includes estimates of \$59 million for assessment costs and \$88 million for remediation costs including funds needed for long-term operations and maintenance of remedies installed at drycleaning plants.

Assessment Costs

Assessment costs are incurred during activities to delineate the nature and extent of contamination. A large portion of the assessment costs at drycleaning plants is due to the expense of investigating groundwater contamination. To date, completed assessments at drycleaning sites have costs ranging between \$51,000 and \$477,000. The average cost of assessing each site is \$182,000. It is anticipated that the average cost will drop at least 10% due to increased efficiencies of the program as experience is gained with more sites. It is also assumed that some lower priority sites will be less expensive to evaluate because it is probable that the contamination will be less extensive than has been found at the higher priority sites.

Assuming the average assessment cost can be decreased to \$161,000, it will require at least \$59 million for assessment costs to investigate the sites.

One of the most common field assessment methods is the Color-Tec Screening Procedure. During the initial phases of assessment, water or soil from the site is collected into a small vial and heated. The air in the vial is then tested for the presence of hydrocarbon compounds. Such real-time assessment in the field allows for faster and more economical delineation of a contaminant plume.

Remediation Costs

Once the sites are investigated, they usually require some type of remedy in order to meet the clean-up standards. Of the sites investigated to date, approximately 75% will require a full remediation system. Even if a full remediation system is not needed because the levels of contamination are below clean-up standards, approximately 20% of the sites will likely require a few years of monitoring to verify that the contamination has stabilized or is decreasing. It is likely that less than 5% of all sites investigated will not need any follow-up expenditure for either remediation or long-term monitoring.

The costs of the installed remedial systems have averaged \$457,000 per site, including all costs of installation and the projected costs of operation and maintenance (O&M) for the number of years that will be required until the clean-up goals are met.

For cost estimating purposes it is assumed that 75% of the sites will need a full remedy. It is also assumed that the average cost of remediation can be reduced 30% (to \$320,000) because lower priority sites should not have the same extent of contamination as the higher-priority sites. Most of the remaining sites will require monitoring to ensure the contamination is adequately addressed. Based on these assumptions, \$86 million will be needed for remediation costs over the lifetime of the Fund.

Direct-push (DP) methods have allowed Fund contractors to rapidly delineate contaminant plumes on most sites. This technology requires use of a small drill rig that pushes and hammers a metal core barrel into the ground. Soil and groundwater samples can be acquired by DP technology for rapid screening of contaminants in the field and eventual laboratory analysis. Unlike groundwater monitoring wells, which are installed and can be re-sampled many times, DP wells are designed to be temporary and inexpensive and are usually abandoned the same day they are drilled.

Five-Year Funding Projection

At the end of FY06, the Fund had a balance of \$1,811,213. However, DHEC has commitments for assessment and remediation totaling \$962,422. This leaves the uncommitted balance as of December 1, 2006 at \$994,491. Due to the uncertainty of the amount of money that the sales tax would generate, the program has delayed starting new site work. Also, during late FY06 and early FY07 (May 2006 through December 2006) personnel losses to the program were dramatic. Therefore, expenditures may be at a minimum for FY07 with a greater increase in FY08 as personnel is replaced.

To complete the funding projection, the income into the Fund was estimated over the next five fiscal years. The historical trend shows income declining steadily from a high in 1997 until the sales tax was implemented (Figure 1). Using trend analysis, the projected income to the Fund will decline over the next five years to a level of \$1,120,545 in FY11 (Figure 3). It is possible, however, that the funding level will stabilize and the decreasing trend will not be realized over the next five years.

Figure 3 also includes a five-year projection of expenditures. This projection indicates that expenditures in years 2007 through 2010 will exceed the income into the Fund. However, by the year 2011 the projection indicates that income and expenditures will be equivalent.

Figure 3: Five Year Projection Comparison of Income versus Expenditures

Fiscal Year	Income to Fund	Total Spent
1996	\$928,545.65	\$42,582.84
1997	\$1,005,142.60	\$106,383.46
1998	\$908,516.14	\$115,929.62
1999	\$864,553.81	\$111,067.06
2000	\$842,913.75	\$308,156.47
2001	\$773,511.14	\$308,078.22
2002	\$657,242.36	\$1,553,734.08
2003	\$612,189.97	\$2,337,642.77
2004	\$654,508.34	\$1,540,095.94
2005	\$1,284,353.96	\$816,404.12
2006	\$1,610,701.00	\$1,090,890.57
2007	<i>\$1,497,951.93</i>	<i>\$1,500,000.00</i>
2008	<i>\$1,393,095.30</i>	<i>\$2,000,000.00</i>
2009	<i>\$1,295,578.62</i>	<i>\$2,100,000.00</i>
2010	<i>\$1,204,888.12</i>	<i>\$1,602,727.80</i>
2011	<i>\$1,120,545.95</i>	<i>\$1,120,545.95</i>

**Table 1: Income and expenditures for the Fund, 1996-2006.
Data for 2007-2011 (in *italics*) are projected.**

3. Public Participation in the Drycleaning Program

One of the goals of the Drycleaning Restoration Trust Fund Program is to encourage public participation in the remedy selection process. Community involvement in the program is important for several reasons. Primarily, it gives local residents an opportunity to have input into choosing a remedial strategy and allows them to address any concerns that they may have about the site. People living near a site may be aware of conditions that could influence the effectiveness of the available remedies. On several occasions, sharing of such important information has substantially aided DHEC's understanding of the site and has steered the remedy choice.

Once appropriate analytical information has been collected on a drycleaning site, a contractor is assigned to review the various technologies that may be effective for remediation. A Feasibility Study (FS) from the contractor provides an in-depth evaluation of the site characteristics and information on the remedies that can be used. Some remedies are eliminated early in the process as impractical for the site. The others are developed further with detailed information on implementation strategies and cost estimates. While the FS will usually point to one or two remedies as clear-cut choices, public input is sought before final selection of a remedy.

Front counter area inside Main Street Cleaners, Marion.

Information about the site and its upcoming remediation is distributed to the public via a legal notice in the local newspaper and letters to area residents, local government officials, and locally-elected members of the S.C. General Assembly. A public meeting is scheduled for a location near the drycleaning site, and the time and place are advertised in the legal notice and individual letters. At the meeting, a DHEC spokesperson presents an overview of site conditions and explains the potential remedies that have been considered. An open forum with a question-and-answer session follows this presentation. A court reporter compiles an official transcript of the meeting, and people are encouraged to call the program's toll-free telephone number (1-866-343-2379) if they have further questions.

A thirty-day public comment period starts at the conclusion of the meeting. All written comments submitted to DHEC and all comments recorded during the public meeting are considered prior to finalizing the remedy selection. The final remedy is documented in a Record of Decision (ROD) signed by the Deputy Commissioner of DHEC's Environmental Quality Control. The ROD includes a response to each comment. These responses are also provided to the person who made the comment. Additionally, an official document repository is established in the community, usually at the public library. The repository includes copies of analytical data, FS, meeting transcripts, the ROD, and any other documents on which the remedy selection may have been based. Since the amount of documentation may be overwhelming for some public libraries, electronic copies of the documents have been provided to some locations. A copy of these documents is also available for public review through the Freedom of Information (FOI) Office during normal business hours at the DHEC Bureau of Land and Waste Management, 8911 Farrow Road, Columbia, S.C. To set up an appointment please contact the FOI Office at 803-896-4288.

Through 2006, eleven public meetings have been held prior to selecting a remedy for sites in the drycleaning program. Additionally, three other meetings have been held to inform the public about ongoing assessment activities for sites that have large off-site groundwater contamination plumes. For these three meetings, area residents were asked to contact DHEC if they had a private groundwater well that could be used for sampling. By these actions, additional private-well sampling points were identified that reduced the total number of monitoring wells to be installed and therefore saved the Fund money.

4. Prioritization

Drycleaners that have registered with DOR are not eligible for the Fund until a completed eligibility application is submitted to DHEC. The eligibility application documents such information as which solvent(s) is used at the site, how long the drycleaner has been in operation, and how the waste products from the cleaning process are disposed. The applicant (usually the drycleaning business owner or land owner) certifies in the application that the drycleaning plant meets all of the eligibility criteria specified in the law. DHEC assigns a priority ranking to the site using information provided in the eligibility application.

The priority rank is determined by a scoring system that emphasizes potential threats to human health that can occur from drycleaning solvent contamination. The scoring system makes assumptions about the potential human exposures to contamination from a site. One common assumption used in scoring the sites is that nearby people use private wells as their source of drinking water if public water lines do not serve the area. Other assumptions are based on site-specific information about the age of the plant, the types of solvents used, regional geology, and surrounding land use. Unless a particular exposure pathway from the site is known to be nonexistent, it is assumed that a potential threat is present via that mechanism. While this approach can overestimate the health threat of a site, it is designed so that a potential threat does not get overlooked.

Section 5 is a listing of all sites that are potentially eligible for the Fund along with their priority ranking. The lower numbers (i.e., 1, 2, 3, etc.) are assigned to the sites that are most likely to have the greatest health effect, thus site #1 is the highest priority site in the state and is thought to be the site most likely to affect the largest number of people. Some of the sites do not yet have a priority ranking. This is primarily because the drycleaner has registered with DOR (and is thus potentially eligible for the Fund) but has not filed an eligibility application with DHEC. The legislation that was passed in 2004 allowed more applications to the Fund, and DHEC is still in the process of evaluating those new applications.

Once eligibility determinations have been made on the new sites, field surveys will be made on all sites that have come into the Fund and prioritization will be conducted on all un-ranked sites. We anticipate that the field surveys of the new sites will be completed in the summer of 2007 with prioritization finished by late 2007. Once completed, a new priority list will be available for public viewing on the DHEC website listed below:

<http://www.scdhec.gov/lwm/html/dryclean.html>.

5. SC Drycleaning Restoration Trust Fund Sites, listed by County

Appendix: South Carolina Drycleaning Restoration Trust Fund Site List

This list is arranged by county. For a listing in order of priority, please refer to the website address <http://www.scdhec.gov/lwm/html/dryclean.html>. Inclusion of sites on this list does not make a site Eligible for the Fund. Scores have been assigned to sites regardless of their Fund Eligibility Status.
